

# Software Engineering

## Agendas

- Data Dictionary
- Entity Relationship Diagram
- Structure Chart

- Collection of names, definitions, and attributes about data elements that are being used or captured in a database, information system, or part of a research project
- Describes the meanings and purposes of data elements within the context of a project, and provides guidance on interpretation, accepted meanings and representation

Provides metadata about data elements

 Metadata can assist in defining the scope and characteristics of data elements, as well the rules for their usage and application.

#### Data Dictionary - Uses

- Assist in avoiding data inconsistencies across a project
- Help define conventions that are to be used across a project
- Provide consistency in the collection and use of data across multiple members of a research team
- Make data easier to analyze
- Enforce the use of **Data Standards**

- Lists all data items appearing in the DFD model of a system
- The data items listed include all data flows and the contents of all data stores appearing on the DFDs in the DFD model of a system
- A data dictionary lists the purpose of all data items and the definition of all composite data items in terms of their component data items

For example,

A data dictionary entry may represent that the data **grossPay** consists of the components **regularPay** and **overtimePay** 

grossPay = regularPay + overtimePay

- For the smallest units of data items, the data dictionary lists their name and their type
- Composite data items can be defined in terms of primitive data items using different data definition operators

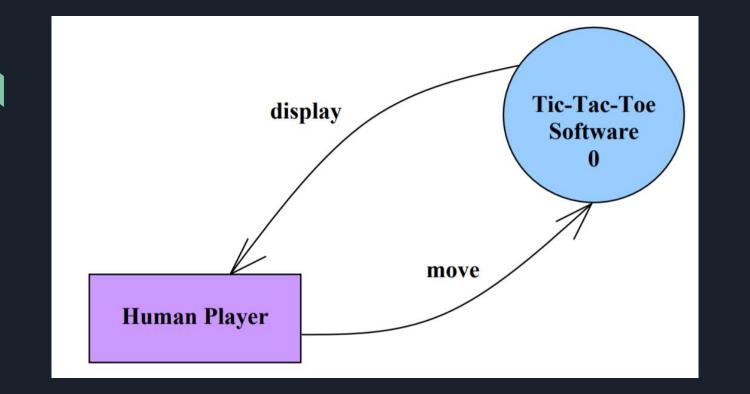

#### Data Dictionary - Operators

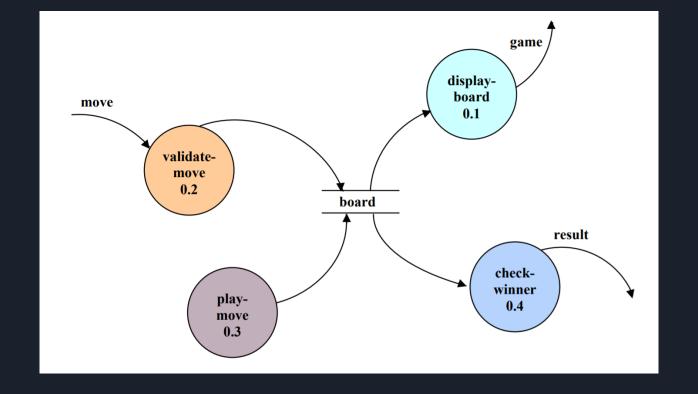

- + : denotes composition of two data items, e.g. a+b represents data a and
   b
- [,,]: represents selection, i.e. any one of the data items listed in the brackets can occur. For example, [a,b] represents either a occurs or b occurs
- (): the contents inside the bracket represent optional data which may or may not appear. e.g. a+(b) represents either a occurs or a+b occurs

#### Data Dictionary - Operators

- { } : represents iterative data definition, e.g. {name}5 represents five name data
- {name}\* represents zero or more instances of name data
- = : represents equivalence, e.g. a=b+c means that a represents b and c
- /\* \*/ : Anything appearing within /\* and \*/ is considered as a comment.

## Data Dictionary - Tic-Tac-Toe

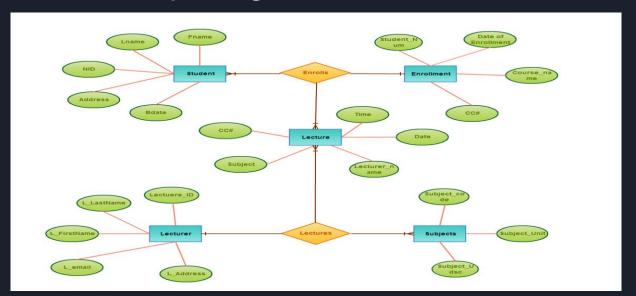

# A single data dictionary should capture all the data appearing in all the DFDs constituting the model

#### Data Dictionary - Tic-Tac-Toe

- move: integer /\*number between 1 and 9 \*/
- display: game+result
- game: board
- **board**: {integer}9
- result: ["computer won", "human won", "draw"]

## Entity Relationship Diagram

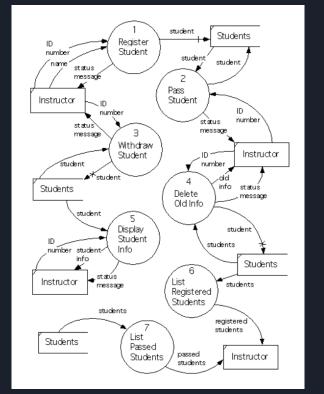

#### Process Specification - PSpecs

- A method used to document, analyze and explain the decisionmaking logic and formulas used to create output data from process input data
- Objective flow down and specify regulatory/engineering requirements and procedures

#### Process Specification - PSpecs

- Reduces ambiguity, allowing an individual or organization to obtain a precise description of executed tasks and accomplishments and validate system design, including the data dictionary and data flow diagrams
- High-quality, consistent data requires clear and complete process specifications

#### PSpecs - Format

**Process Name:** Register Student

**Process Number: 1** 

Inputs: ID number, name

Outputs: status message, student

#### **Process Logic:**

- Staff Supplies students details
- Student data is stored in the data store
- If ID number is invalid, a failed status message will be given
- If ID number is valid, a success status message with student info will be given

#### Structure Chart

- Represent hierarchical structure of modules
- Breaks down the entire system into lowest functional modules, describe functions and sub-functions of each module of a system to a greater detail
- Partitions the system into black boxes (functionality of the system is known to the users but inner details are unknown). Inputs are given to the black boxes and appropriate outputs are generated.

#### Module

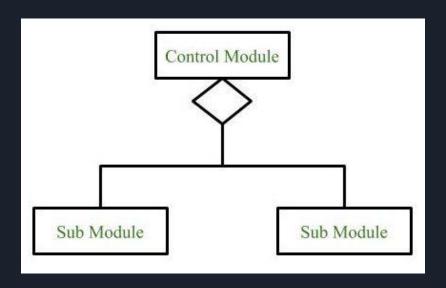

Represents the process or task of the system

- Control Module: A control module branches to more than one sub module
- Sub Module: Sub Module is a module which is the part (Child) of another module
- Library Module: Library Module are reusable and invokable from any module

#### Conditional Call

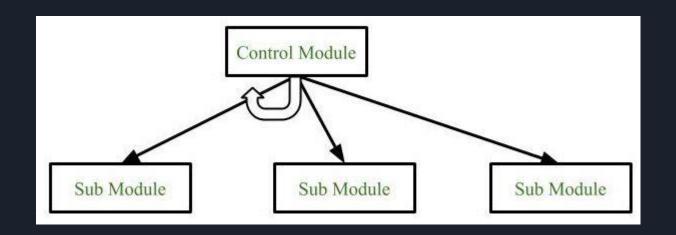

Represents that control module can select any of the sub module on the basis of some condition

#### Loop

Represents the repetitive execution of module by the sub module

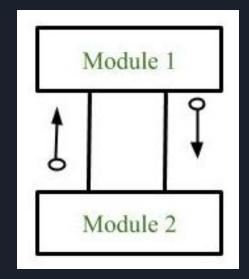

A curved arrow represents loop in the module

#### Data Flow

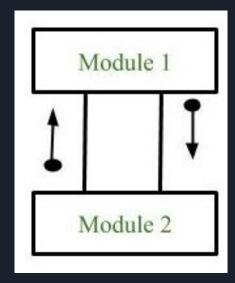

Represents the flow of data between the modules

It is represented by directed arrow with empty circle at the end

#### Control Flow

Represents the flow of control between the modules. It is represented by directed arrow with filled circle at the end

Physical Storage

Where all the information are to be stored

Physical Storage
